dinucleotide - encoding antigen Use of oligonucleotides containing an unmethylated CpG useful as, e.g. adjuvant with antigen, or nucleic acid for inducing immune response in subject. Use of useful

67pp; English. Disclosure; Page 12;

Oligonucleotides containing at least 1 unmethylated CpG dinucleotide affect the immune response in a subject by activating natural killer cells or redirecting a subject's immune response from a Th2 to a Th1 response by inducing monocytic and other cells to produce Th1 cytokines. These nucleic acids containing at least 1 unmethylated CpG can be used as an adjuvant, specifically to induce an immune response against an

The method is for treating a subject having, or at risk of having an acute decrement in air flow, comprising administering a nucleic acid sequence containing at least one unmethylated CpG. The nucleic acids containing an unmethylated CpG dinucleotide affect an immune response in a subject by activating natural killer cells (NK) or redirecting a subject's immune response from a Th2 to a Th1 response by inducing monocytic and other cells to produce Th1 cytokines. They can be used to treat pulmonary disorders having an immunologic component, such as asthma or environmentally induced airway disease. They can also be used to treat diseases associated with Grampositive bacterial infections or endotoxaemia including bacterial meningitis, neonatal sepsis, cystic fibrosis, inflammatory bowel disease
                                                                                                                                                                                                                                                                                                                                                                                                                                           Unmethylated CpG dinucleotide; immune response; bacterial meningitis; natural killer cell activation; NK cell; Th2 response; neonatal sepsis; pulmonary disorder; asthma; environmentally induced airway disease; bacterial infection; endotoxaemia; therapy; cystic fibrosis; inflammatory bowel disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         dominal

AAV27641-751 represent immunostimulatory oligodeoxyribonucleotides (ODNs) of the invention. The ODNs contain at least one unmethylated CpG dinucleotide, and have the formula: 5' NIXICGX2N2 3', where at least one nucleotide separates consecutive CpGs, X1 is adenine, guanine, or thymine, X2 is cytosine or thymine, N is any nucleotide and N1+N2 is 0-26 bases with the provision that N1 and N2 does not contain a CCGG tetramer or more than one CCG or CGG trimer OR 5' NXIX2CGX3X4N 3', where at least one nucleotide separates consecutive CpGs, X1 and X2 are selected from GpT, GpG, GpA, ApT and ApA, X3 and X4 are selected from TpT or CpT, N is any nucleotide and N1+N2 is 0-26 bases with the provision that N1 and N2 does not contain a CCGG tetramer or more than one CCG or CGG trimer. The ODNs activate lymphocytes in a subject and redirect a subject's immune response from a Th2 to a Th1 (e.g. by inducing monocytic cells and other cells to produce Th1 cytokines, including IL-12, IFN-gamma and GM-CSF). The ODNs can be used to treat or prevent an asthmatic disorder, autoimmune diseases, in desensitisation therapy, as an artificial dignumber of the contain a mammal such as a mouse or a mouse or a mammal such as a mouse or a mouse or a mammal such as a mouse or a mouse or a mammal such as a mouse or a mou

Sequences AAZ41856-Z41949 are phosphorothioate CpG oligonucleotides which are used in the invention to induce interleukin-12 (IL-12) secretion from human PBMC. The invention comprises stimulating an immune response in a subject comprising administering to a subject exposed to an antigen, an immunopotentiating cytokine and an immunostimulatory CpG oligonucleotide to induce a synargistic antigen specific immune response. The methods are useful for treating cancer by stimulating an antigen specific immune response against a cancer antigen. The methods can also be used to treat neoplastic disorders in humans, including but not limited to: sarcoma, carcinoma, fibroma, Lymphoma, melanoma, neuroblastoma, retinoblastoma, and glioma. The methods are also useful for treating infectious diseases.

The methods and compositions may also be applied to treat cancer and tumours in non human subjects, e.g. cats and dogs. Neoplasias affecting agricultural livestock may also be treated and include leukaemia, haemangiopericytoma and bovine ocular neoplasia. Chronic, infectious, contagious diseases of sheep and goats caused by the bacterium contrating B cells, NK cells, and antigen presenting cells, such as monocytes and macrophages. CpG oligonucleotides enhance antibody contagions with trumour antion and can be used as an adjurant in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence is used in the description of a method for enhancing the immunostimulatory effect of an antigen encoded by nucleic acid contained in a nucleic acid construct. The method involves determining the CpG-N and CpG-S motifs present in the construct, removing neutralising CpG (C-N) motifs and optionally inserting stimulatory CpG (CpG-S) motifs in the construct, thereby producing a nucleic acid construct having enhanced immunostimulatory efficacy. The method can be used for immunisation against viral antigens, e.g. from hepatitis B virus (HBV), bacterial antigens or an antigen derived from a parasite. They can also be used fexpression of a therapeutic polypeptide, e.g. growth factors, toxins, tumour suppressors, cytokines, apoptotic proteins, interferons, hormone clotting factors, ligands and receptors.                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAV74237-V74253 are oligodeoxynucleotide (ODN) primers used to describe method for enhancing the immunostimulatory effect of an antigen encoded by nucleic acid contained in a nucleic acid construct. The method involves determining the CpG-N and CpG-S motifs present in the construct removing neutralising CpG (CpG-N) motifs and optionally inserting stimulatory CpG (CpG-S) motifs in the construct, thereby producing a nucleic acid construct having enhanced immunostimulatory efficacy. The method can be used for immunisation against viral antigens, e.g. from hepatitis B virus (HBV), bacterial antigens or an antigen derived from parasite. They can also be used for expression of a therapeutic polypeptide, e.g. growth factors, toxins, tumour suppressors, cytokines apoptotic proteins, interferons, hormones, clotting factors, ligands an receptors. AAZ60933-Z61015 represent immunostimulatory stereoisomers of CpG
oligonucleotides. The sequences are derived from generic nucleic acid
sequence, from which immunoinhibitory sequences may also be derived. The
immunostimulatory nucleic acids can be co-administered with an antigen to
induce an antigen-specific immune response. The immunostimulatory nucleic
acids can also be used in methods for redirecting a subject's immune
c acids can also be used in methods for redirecting a subject immune
c acids can also be used in methods for redirecting a subject immune
c acids can also be used in methods for redirecting a subject immune
c subject against the occurrence of an allergic reaction in response to
contact with an allergen, for activating an immune cell, especially a
lymphocyte or a dendritic cell expressing a cancer antigen or for
treating cancer. The immunoinhibitory nucleic acid can be used to prevent
an immune response, especially where the immune response in the subject
is excessive due to having received an immune stimulating compound. The
immunoinhibitory nucleic acid can be used to treat a subject having or at
risk of an inflammatory disease, especially inflammatory bowel disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                        The present invention describes a method using CpG containing oligonucleotides (ONB) for regulating immune system remodeling and for regulating haematopoiesis. The method for inducing an antigen-specific immune response comprises: (1) administering an ON having a sequence including at least the formula (1); and (2) exposing the subject to an antigen at least 3 days after the ON is administered to the subject to an antigen sub-specific immune response: 5 'XICGX2 3' (1), where the CN = includes at least 8 nucleotides; C and G = unmethylated, and X1 and X2 = nucleotides. The method can be used for inducing an immune response against an antigen such as cells, cell extracts, proteins, carbohydrate, viral extracts, viruses, bacteria, fungi, parasites and alergens. It can be used in subject at risk of developing cancer or an alerger reaction. It can also be used for treating an infectious disease, allergic reaction. It can also be used for treating an infectious is drug-induced, due to an autoimmune disorder such as idiopathic tradiation exposure. It can also be used for treating ansemia such as drug-induced anaemia, immunohaemolytic disease such as kidney failure, and choncic inflammatory disorder such as kidney failure, and controi inflammatory disorder such as kidney failure, and resulting from accidental or therapeutic radiation exposure. AAX47932 to AAX48029 represent phosphorothioate CpG oligonucleotides used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            e; antigen;

The present invention describes a method using CpG containing oligonucleotides (ONs) as adjuvants for inducing an immune response (MIR) comprises: (1) administering to a mucosal immune response (MIR) comprises: (1) administering to a mucosal surface of a subject an ON, having a sequence including at least the formula (I); and (2) exposing the subject to an antigen to induce the MIR, where the antigen is not encoded in a nucleic acid vector: 5'XIXZCGX3X43' (I), where C and (2 = unmethylated, and X1, X2, X3 and X4 = nucleotides. The method can be used for treating a subject at risk of developing an allergic reaction, cancer or infectious cubject at risk of developing an allergic reaction, cancer or infectious disease. It can be used for treating asthmatic subjects, eczema, allergic rhinitis or coryza, hay fever, conjunctivitis, bronchial asthma, urticaria, food allergies or other atopic conditions. The antigen may be derived from infectious organisms such as infectious bacteria, viruses, parasites or fungi. It can be used in humans or animals, e.g. bovine, parasites or fungi. It can be used in humans or animals, e.g. bovine, conince, felline, swine, aquatic or avian species. The ONs act as potent mucosal adjuvants to induce immune responses at both local and remote sites against an antigen administered to the mucosal tissue Both systemic and mucosal immunity are induced by mucosal delivery of the ONS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                8
                                                                                                                                                                                                                                                         The present invention describes an adjuvant composition (A) comprising an immunostimulant (I) absorbed on a metallic salt particle (II) that is practically free of antigen (Ag). Also described are: (1) preparation of a vaccine by mixing (A) with Ag; (2) vaccine comprising two major populations of comprising, in separate containers, monophosphoryl lipid A (MPL) adsorbed on metal salt and Ag adsorbed on metal salt. (A) has antiviral, antibacterial, antiprotozoal, antimalarial, anti-allergic and anticancer activities, and can be used to induce a specific immune response. (A) are used in preparation of vaccines for treatment or prevention of a wide range of viral, bacterial and protozoal infections, also allergy and cancers. By adsorbing (I) and Ag on separate particles (vaccines (including those containing many Ag) can be produced simply by mixing, rather than by sequential adsorption of many components on to the same particles (which is time-consuming, expensive and difficult to control). The component may be tested individually and failure of any one component does not require rejection of an entire batch of vaccine. The new vaccines are as effective as those prepared conventionally. The present sequence represents a CpG immunostimulatory oligonucleotide which is the used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                    which
                                                                                                                                                                                parasitic infection by administration of unmethylated CpG
oligonucleotides. The CpG oligonucleotides are able to stimulate the
innate immune system via the activation of immune cells, such as antigen
presenting cells, natural killer cells and granulocytes. The CpG
oligonucleotides and the method can be used to treat and prevent
parasitic diseases, such as malaria, helminth diseases, tick and mites in
humans, animals and poultry. The oligonucleotides may be administered in
conjunction with parasiticides or other therapeutic compounds after an
organism has been diagnosed to be infected with parasites. Diseases which
can be treated or prevented include those caused by Plasmodium
falciparum, P. ovale, P. malariae, P. vivax, P. knowlesi, Babesia
microti, B. divergens, Trypanosoma cruzi, T. gambiense, T. rhodesiense,
Schistosoma mansoni, Toxoplasma gondii, Trichinella spiralis, Leishmania

                                                                       which
                                                                  The present sequence represents an immune stimulatory nucleic acid, which is included in the particles of the invention. The structure of these particles is based in part on duck hepatitis B viral core antigen (HBcAg). The particles are used for hapten presentation so as to elicit an immune response. The particles are formed by assembling recombinant forms of duck HBcAg, and are highly immunmogenic. Native duck HBcAg particles are 32-34 nm particles composed of 240 identical subunit monomers, and are very similar to human HBcAg. However, duck HBcAg is not cross-reactive with human HBcAg. Recombinant forms of duck hepatitis B virus elicit a TH1 (T helper cell) immune response. The duck HBcAg particles are used to elicit an immune response in a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   as to elicit recombinant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents an immune stimulatory nucleic acid, whis included in the particles of the invention. The structure of these particles is based in part on duck hepatitis B viral core antigen (HBCAg). The particles are used for hapten presentation so as to elicit an immune response. The particles are formed by assembling recombinant forms of duck HBCAg, and are highly immunmogenic. Native duck HBCAg particles are 32-34 nm particles composed of 240 identical subunit monomers, and are very similar to human HBCAg. However, duck HBCAg is recoss-reactive with human HBCAg. Recombinant forms of duck hepatitis B virus elicit a THI (T helper cell) immune response. The duck HBCAg particles are used to elicit an immune response in a patient.
monomers, and are very similar to human HBcAg. However, duck HBcAg is cross-reactive with human HBcAg. Recombinant forms of duck hepatitis E virus elicit a TH1 (T helper cell) immune response. The duck HBcAg particles are used to elicit an immune response in a patient. Polynucleotides encoding the particles may be used in gene therapy protocols
                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A composition useful for inducing an immune response comprises nucleocapsid protein monomers, derived from duck hepatitis B virus, are assembled to form a particle.

The present invention relates to an adjuvant composition comprising a saponin and an immunostimulatory oligonucleotide. A vaccine composition containing the adjuvant is useful for inducing an immune response in an individual and for preventing or treating disease. Diseases include cancers, allergy, Alzheimer's disease and atherosclerosis. The vaccine is also useful for prophylaxis and treatment of viral, bacterial and parasitic infections. The present sequence is an oligonucleotide of the invention
                                                                                                                                                                                                  s disease;

Sequence 90, Application US/09286098
Sequence 90, Application US/09286098
Patent No. 6218371
GENERAL INFORMATION:
APPLICANT: Krieg, Arthur M.
APPLICANT: Weiner, George
TITLE OF INVENTION: Immune System Using Immunotherapeutic Oligonucleotides and TITLE OF INVENTION: Cytokines
FILE REFERENCE: C1039/7026/HCL
CURRENT APPLICATION NUMBER: US/09/286,098
CURRENT FILING DATE: 1999-04-02
EARLIER APPLICATION NUMBER: US 60/080,729
EARLIER FILING DATE: 1998-04-03
NUMBER OF SEQ ID NOS: 105

Sequence 46, Application US/09337619

Patent No. 6653292

GENERAL INFORMATION:

APPLICANT: Krieg, Arthur M.

TITLE OF INVENTION: Methods of Treating Cancer Using

TITLE OF INVENTION: Immunostimulatory Oligonucleotides

FILE REFERENCE: C1039/7021/HCL

CURRENT APPLICATION NUMBER: US/09/337,619

CURRENT FILING DATE: 1999-06-21

EARLIER APPLICATION NUMBER: US 08/960,774

EARLIER APPLICATION NUMBER: US 08/738,652

EARLIER FILING DATE: 1996-10-30

EARLIER FILING DATE: 1996-10-30

EARLIER FILING DATE: 1996-07-15

MUMBER OF SEQ ID NOS: 123

NUMBER OF SEQ ID NOS: 123

SOFTWARE: FastSEQ for Windows Version 3.0

Patent No. 6339068

GENERAL INFORMATION:

APPLICANT: Davis, Heather L.

APPLICANT: Schorr, Joachim

APPLICANT: Wu, Tong

TITLE OF INVENTION: Vectors and Methods for Immunization or

TITLE OF INVENTION: Therapeutic Protocols

FILE REFERENCE: C1039/7009

CURRENT APPLICATION NUMBER: US/09/082,649B

CURRENT FILING DATE: 1998-05-20

PRIOR APPLICATION NUMBER: US 60/047,233

PRIOR FILING DATE: 1997-05-20

PRIOR PILING DATE: 1997-05-20

PRIOR FILING DATE: 1997-05-20

NUMBER OF SEQ ID NOS: 85

SOFTWARE: FastSEQ for Windows Version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     APPLICANT: Davis, Heather L.

Sequence 77, Application US/09895007A

Sequence 77, Application US/09895007A

Patent No. US20020165178A1

GENERAL INFORMATION:

APPLICANT: Schetter, Christian

APPLICANT: Bratzler, Robert L.

APPLICANT: Bratzler, Robert L.

APPLICANT: Petersen, Deanna M.

TITLE OF INVENTION: IMMUNOSTIMULATORY NUCLEIC ACIDS FOR THE

TITLE OF INVENTION: TREATMENT OF ANEMIA, THROMBOCYTOPENIA,

FILE REFERENCE: C1041/7014 (AMS)

CURRENT APPLICATION NUMBER: US/09/895,007A

CURRENT FILING DATE: 2000-06-28

PRIOR FILING DATE: 2000-06-28

NUMBER OF SEQ ID NOS: 133

SOFTWARE: FastSEQ for Windows Version 3.0

SEQ ID NO 77

LENGTH: 24

GENERAL INFORMATION:

APPLICANT: Coley Pharmaceutical Group Inc.

APPLICANT: Coley Pharmaceutical GmbH

APPLICANT: Coley Pharmaceutical GmbH

APPLICANT: University of Iowa Research Foundation

TITLE OF INVENTION: Combination Motif Immune Stimulatory Oligonucleotides with Improv.

TITLE OF INVENTION: Activity

FILE REFERENCE: C01039/70063W0 (HCL/AWS)

CURRENT APPLICATION NUMBER: PCT/US02/26468

CURRENT FILING DATE: 2002-08-19

PRIOR FILING DATE: 2001-08-17

PRIOR FILING DATE: 2001-08-17

PRIOR FILING DATE: 2002-07-03

NUMBER OF SEQ ID NOS: 81

SOFTWARE: PatentIn version 3.1

SEQ ID NO 39

US-11-179-008-147

Sequence 147, Application US/11179008

GENERAL INFORMATION:
APPLICANT: Hartmann, Gunther
APPLICANT: Bratzler, Robert L.
APPLICANT: Bratzler, Robert L.
TITLE OF INVENTION: Methods Related to Immunostimulatory
ITILE OF INVENTION: Mucleic Acid-Induced Interferon
FILE REFERENCE: C1039, 700440502
CURRENT APPLICATION NUMBER: US/11/179,008
CURRENT FILING DATE: 2000-09-27
PRIOR FILING DATE: 2000-09-27
PRIOR FILING DATE: 1999-09-27
NUMBER OF SEQ ID NOS: 169
SOFTWARE: FastSEQ for Windows Version 3.0
SEQ ID NO 147
LENGTH: 24
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    COMPOSITIONS AND METHODS OF

/note="Vector: pBluescript II KS(+); Site_l: EcoRI;
Site_2: Not1; This normalized library was—constructed from
1 million independent clones. cDNA synthesis was initiated
using an oligo(dT) primer, using methylated C in the first
strand synthesis reaction. Following this first strand
reaction, double-stranded cDNA was blunted, ligated to
NotI adapters, digested with EcoRI, size-selected, and
cloned into the NotI and EcoRI compatible sites of a
custom modified MCS of the pBluescript (KS+) vector. The
library was normalized in 2 rounds using conditions
adapted from Soares et al., PNAS (1994) 91: 9228-9232 and
Bonaldo et al., Genome Research 6 (1996): 791, except that

The library was constructed by Brandi Chiapelli and Dr.
James McCarter at Washington University, St. Louis. The
cDNA was made by using Dynabead oligo-dT priming (Dynal).
PCR based library using a modified protocol from the SMART
PCR cDNA Synthesis Kit from Clontech. Directionally cloned
into the UDG sites of pAMP1. Nematodes are the OP25
strain. Frozen J2 nematodes were provided by Dr. Rick
Davis of North Carolina State University"

Washington University, St. Louis. DNA Sequencing by: Washington
University Genome Sequencing Center St. Louis.
High quality sequence stop: 310.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The library was constructed by Brandi Chiapelli and Dr.
James McCarter at Washington University, St. Louis. The CDNA was made by using Dynabead oligo-dT priming (Dynal). PCR based library using a modified protocol from the SMART PCR cDNA Synthesis Kit from Clontech. Directionally cloned into the UDG sites of pAMP1. Nematodes are the OP25 strain. Frozen J2 nematodes were provided by Dr. Rick Davis of North Carolina State University"

The cDNA was made by using Dynabead oligo-dT priming (Dynal). PCR based library using a modified protocol from the SMART PCR cDNA Synthesis Kit from Clontech. Directionally cloned into the UDG sites of pAMP1. Nematodes are the OP25 strain. Frozen J2 nematodes were provided by Dr. Rick Davis of North Carolina State University"
